

GLOBAL SALES AND FINANCIAL PERFORMANCE

INTERACTIVE SALES DASHBOARD

NAME: MITHRASRI G

GROUP: B.COM FINTECH AND AI

ROLL NO: E25FA027

1. Introduction

For this project, I created a Global Sales Performance Dashboard using Microsoft Power BI. The dashboard is designed to analyse sales performance using information related to products, customers, employees, dates and geographical regions.

The main purpose of the dashboard is to convert sales data into simple and meaningful visual information. It provides an overview of sales, cost, profit, quantity and orders, while allowing the user to analyse performance from different business perspectives.

The interactive dashboard helps users compare sales across categories, months and regions and understand profit contribution by employees and products.

2. Objectives

The main objectives of this project are:

- To analyse overall global sales performance.
- To understand total sales, cost and profit.
- To analyse the total quantity sold and number of orders.
- To compare sales across different product categories.
- To track sales performance across months.
- To compare sales performance across geographical regions.
- To analyse profit contribution by employees.
- To examine product-level sales and profit performance.
- To create an interactive dashboard using Power BI.
- To support better business decision-making through data visualization.

3. Dataset Description

The dataset used for this project contains sales information along with related product, customer, employee, date and geographical information.

The major information used in the dashboard includes:

Date Information

- Date
- Year
- Quarter
- Month

- Month Name
- Day
- Day of Week
- Is Weekend
- Is Holiday

Product Information

- Product Name
- Category
- Subcategory
- Colour
- Size
- Standard Cost
- List Price

Geography Information

- Country
- Region
- City

Sales Information

- Quantity
- Unit Price
- Discount
- Sales Amount
- Total Cost
- Profit
- Channel
- Payment Method
- Order Priority

Customer Information

- Customer Name
- Signup Date
- Loyalty Tier
- Gender

Employee Information

- Employee Name
- Hire Date
- Role
- Geography

These fields allow sales performance to be analysed from different perspectives.

4. Data Preparation

Before creating the dashboard, the data was organised in Power BI so that sales information could be analysed using the related tables.

The main preparation activities included:

- Organising the date information using the Date table.
- Using the sales data as the main transaction-level information.
- Organising product, customer, employee and geographical information into related tables.
- Checking the important numerical fields such as sales amount, total cost, profit and quantity.
- Establishing relationships between the sales table and the related tables.
- Creating DAX measures for the key performance indicators.

This preparation helped create an organised data model and made the dashboard easier to analyse.

5. DAX Measures Used

DAX measures were created to calculate the important performance indicators used in the dashboard.

DAX Measure Purpose

Total Sales	Calculates the total sales amount
Total Cost	Calculates the total cost
Total Profit	Calculates the total profit
Total Quantity	Calculates the total quantity sold
Order Count	Calculates the number of orders
Average Sales	Calculates the average sales amount

These measures help provide a quick summary of business performance and are also used in the dashboard visuals.

6. Dashboard Components

KPI Cards

The dashboard contains KPI cards that provide a quick summary of important performance indicators.

The KPIs include:

- Total Sales
- Total Cost
- Total Profit
- Order Count
- Average Sales

These cards help users understand the overall performance of the business at a glance.

Total Sales by Category

A column chart is used to compare total sales across different product categories.

This visual helps identify which categories contribute more to total sales and which categories have comparatively lower sales.

Total Sales by Month

A line chart is used to display total sales across different months.

This helps users understand changes in sales performance over time and identify periods with relatively higher or lower sales.

Total Sales by Region

A donut chart is used to display total sales according to different geographical regions.

This visual helps compare the contribution of different regions to overall sales performance.

Total Profit by Employee

A clustered bar chart is used to compare total profit across employees.

This provides a view of differences in profit contribution among employees and helps analyse employee-level performance.

Product Performance Table

A table is used to provide detailed product-level information.

The table includes:

- Product Name
- Total Sales
- Total Profit
- Total Quantity

This allows users to compare individual products using different performance indicators.

7. Slicers Used

Three slicers are used to make the dashboard interactive:

- Year
- Category
- Region

The slicers allow users to select a particular year, product category or geographical region.

When a selection is made, the dashboard visuals update accordingly. This makes it easier to analyse specific parts of the sales data instead of viewing only the overall results.

8. Key Findings

The Global Sales Performance Dashboard provides the following important areas of analysis:

- Total Sales provides an overview of the revenue generated by the business.

- Total Cost helps understand the cost associated with sales.
- Total Profit helps evaluate the profitability of the business.
- Order Count provides information about the number of orders.
- Average Sales helps understand the average value of sales.
- Sales can be compared across different product categories.
- Monthly analysis helps identify changes in sales performance over time.
- Regional analysis helps identify differences in sales contribution across geographical markets.
- Employee-level analysis provides a comparison of profit contribution.
- The product table provides detailed information about product sales, profit and quantity.
- The slicers allow users to analyse the dashboard based on year, category and region.

9. Conclusion

Working on the Global Sales Performance Dashboard helped me understand how Power BI can be used to convert sales data into meaningful business information.

The dashboard combines KPI cards, charts, a product table and slicers to provide an interactive view of sales performance. DAX measures were used to calculate important indicators such as sales, cost, profit, quantity, order count and average sales.

The different visuals provide useful perspectives on category-wise, monthly, regional, employee and product-level performance.

Overall, this project helped me understand how Power BI and data visualization can support business analysis and better decision-making.
